A chimeric antibody (AAW14939) comprises the Cl and hinge regions of human IgG2 and the C2 and C3 regions of human IgG4 (G2/G4 MAD) and a murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (MAD) 3F4 heavy chain variable region sequence (see also AAW14938). The chimeric antibody is specific for porcine VCAM. It is useful for diagnosing human rejection of porcine centransplants and for improving xenotransplants and organs into human recipients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A chimeric antibody (AAW14940) comprises the Cl and hinge regions of human IgG2 and the C2 and C3 regions of human IgG4 (G2/G4 MAb) and an murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (MAb) 3F4 heavy chain variable region sequence (see also AAM1493B). The recombinant binding molecule of the invention. The recombinant binding molecule of binding a target molecule without triggering complement dependent lysis, or the call-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and domain of a human inamunosjlobulin (GigG) heavy chain. The binding molecule is used to bind a target molecule (especially FogammaRIE) causing inhibition of B cell activation, mast cell degranulation or binding molecule can be used to prevent or inhibit the binding of a second binding molecule. Gig an antibody, to the target molecule. The binding molecule is useful for the treatment of graft-vs_host disease, organ transplant rejection, bone-marrow transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cell-mediated destruction; human; immunoglobulin G; 1gG heavy chain; croph's disease; draft-vs-host disease; organ transplant rejection; bone-marrow transplant rejection; autoimmune disease; asthma; allergy; autoimmune disease; asthma; allergy; autoimmune thrombocytopaenia; arthritis; erythroblastosis foetalis; entitle alloimmune thrombocytopaenia; goodpastures disease; therapy;

rejection, autoimmunity (e.g. vasculitis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. foetal/neonatal alloimmune thrombocytopaenia, asthma and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN (erythroblastosis foetalis), Goodpastures, sickle cell anaemia and coronary artery orclusion). The binding molecules do not activate complement or trigger cytotoxic activities through FogammaR and desirable 1gG properties have been retained. The polypeptides do not contain non-human amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind protein A, which is consistent with being able to cross the human placenta through interaction with FCRn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAR41707-09 are encoded by the expression vector pAH4625. This vector represents the cloning of the human gamma isotype, gamma-2, with the variable region of the murine monoclonal antibody 128.1. This plasmid encodes a chimeric monoclonal antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymerase chain reaction; primer; PCR; amplify; murine; pAH4625; heavy: light; chain; variable; constant; region; anti-human; pAH4807; transferrin; receptor; antibody; brain; capillary; pAH4808; gamma-2; endothelial cell; conjugate; neuropharmaceutical; gamma-3; gamma-4; diagnostic; agent; tumour; AIDS; stroke; epilepsy; monoclonal; Parkinsons disease; Alzheimers disease; SP2/0 cell.

```
in which the heavy chain (VH) is derived from a murine source and the sequences encoding CH1. CH2 and CH3 are derived from a human source. This vector, in combination with the chimmeric light chain vector, pAG4611 (see also AAQ43845), was transfected into SP2/0 cells and clones were isolated "18.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial colls. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods.

complement or trigger cytotoxic activities and maintaining desirable Immunoglobulin-derived binding molecules that do not activate immunoglobulin properties -

Claim 12; Fig 17; 81pp; English.

This sequence represents the mutated CH2 molecule G2deltaa, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement

```
dependent lysis, or the cell-mediated destruction of the target

comprises: (a) a binding domain capable of binding a target molecule;

comprises: (a) a binding domain capable of binding a target molecule;

comprises: (b) an effector domain that is homologous to all or part of a constant

consider the binding molecule (especially FegammaRID

considerable inhibition of B cell activation, mast cell degranulation or replayocytosis). The binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule is useful for the transplant consecute. The binding molecule is useful for the transplant rejection, autoimmunity (e.g. vasculitis, autoimmune haemolytic anaemia, activine autoimmune thrombocytopaenia and arthritis), alloimmunity

cautoimmune thrombocytopaenia and activities of consensation and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN

cartoimmune thrombocytopaenia, asthma and allergy), coronary artery occlusion). The binding molecules do not activate

complement or trigger cytotoxic activities through FegammaR and desirable consensement or trigger cytotoxic activities through regammaR and desirable immunogenicity. Further, they still bind protein A, which is consistent immunogenicity Further, they still bind protein A, which is consistent with being able to cross the human placenta through interaction with FCRn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Fc region-containing polypeptides that have altered effector function due to one or more amino acid modifications in the Fc region, useful in the treatment of cancer and allergic conditions such as asthma -

                                                                                                                                                                                                                                                                                                                                                δ
                                               AAB07474-78 represent native IgG Fc regions. The proteins are used to produce Fc region-containing polypeptides that have altered effector function as a consequence of one or more amino acid modifications in the Fc region. The variant polypeptides are useful for treating cancer, allergic conditions such as asthma (with an anti-IgE antibody), and LEA-1-mediated disorders. Where the polypeptide binds the HER2 and LEA-1-mediated disorders. Where the polypeptide binds the HER2 receptor, the disorder preferably is HER2-expressing cancer, e.g. a benign or malignant tumour characterized by overexpression of the HER2 receptor. Such cancers include breast cancer, squamous cell cancer, small-cell lung cancer, non-small cell lung cancer, pladder cancer, gastrointestinal cancer, pladder cancer, pladder cancer, olon cancer, coloncarcal cancer, endometrial carcinoma, salivary gland carcinoma, kidney cancer, liver cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma and various types of head and neck cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a fusion protein, comprising a peptide ligand and an immunoglobulin (Ig) constant region multimerization domain (Ib). The hybrid melecules comprising the peptide ligands and their functional derivatives can be used in the same applications as, a peptide ligand can be used. For

This invention relates to non-naturally occurring peptide ligands which bind to the human erbB2 gene product ErbB2 (also known as HER2). Peptides represented in AAB76350 - AAB76420 and AAB76432 - AAB76509 are examples of the ErbB2 binding ligands of the invention. Sequences used in the invention of the peptides of the invention. The peptides compete for binding ErbB2 with naturally occurring ligands, and may be used to treat disorders characterized by over expression of HER2/ErbB2 such as cancers. CC diseases of the nervous system musculature and epithelia, e.g. nervous system damage resulting from trauma, surgery, strokes, ischaemia, cinfection, metabolic disorders, nutritional deficiency or toxic agents. CI nparticular the synthetic peptide ligands may be used to treat Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease con an one of the diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; erbB2; HER2; cancer; nervous system disease; stroke; ischaemia; metabolic disorder; nutritional deficiency; Alzheimer's disease; Parkinson's disease; epilepsy; multiple sclerosis; Huntington's chorea; Down's syndrome; nerve deafness; Meniere's disease; diabetic neuropathy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is human immunoglobulin G2 (IgG2) constant region mature protein. IgG2 forms a fusion protein with human erythropoietin (EPO). EPO has improved biological activity and an extended serum half life greater than 20 hours. The present invention relates to modified EPO forms such as fusion proteins comprising a FC portion of an immunoglobulin (Ig) molecule and an EPO molecule (FC-EPO). The FC portion is fused covalently through its C-terminus directly or indirectly to the EPO molecule, and where the FC portion as well as EPO portion may be modified or mutated. The invention also relates to non-fused EPO molecules which have a pattern of cysteines or disulphide bonding which is distinct from human or animal EPO Pharmaceutical compositions or an eruseful in the treatment of EPO deficient diseases such as anaemia, renal failure, HIV infection, blood loss and chronic disease that can be treated with haematopoietic growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gillies S;

The invention relates to vaccine compositions comprising a vaccine and a timed release formulation of a cytokine or cytokines/immunoglobulin fusion protein or plasmid at one or more temporal points subsequent to vaccine administration. The vaccines can be used for treating an autoimmune disease, an infectious disease, an inflammatory disease, a neoplastic disease, or an immunologic disease in an individual. The vaccines can be used to elicit immune responses against diseases such as AIDS, malaria, tuberculosis, hepatitis C, hepatitis B, cancer or influenza. The methods an antibody response, a cellular proliferative response as well as an antibody response, a cellular proliferative response as well as cytotoxic T-lymphocyte levels. In addition the Ig can increase the circulating half life of the cytokine. The present sequence represents a human interleukin-2 (IL-2)/Ig fusion protein.
                                                                                                                                                                                                                                                                                                   Fusion protein; vaccine; cytokine; immunoglobulin; autoimmune disease; infectious disease; inflammatory disease; neoplastic disease; cancer; immunologic disease; immune response; malaria; tuberculosis; hepatitis; AIDS; influenza; interleukin; II-2; Ig; human.

The protein is efficiently assembled intracellularly and effectively secreted from mammalian cells pref. CHO, COS, or myeloma cells as a homodimer, enabling high recovery and purification from the medium of cells expressing it. It possesses increased serum half-life and has increased avidity for HIV of heavy chain dimers. It can inhibit HIV infection of CD4 cells and block the spread of HIV infection within a patient. Attachment to a detectable marker makes it useful in an assay for HIV or SIV infection, and it can also be linked to toxins, ego biphtheria, peeudomnas exotoxin A (domains I or II) or the deglycosylated A-chain

A CD4-gamma 2 chimeric heavy chain homodimer is linked to a non-peptidyl toxin or a gamma radiation-emitting radionuclide of low to moderate cytotoxicity. The resulting immunoconjugate comprising the toxin can be used to kill HIV infected cells and to treat HIV infected subjects to reduce the population of HIV infected cells. It can also be used to reduce the likelihood of infection. The immunoconjugate comprising the radionuclide can be used to image HIV efficacy of an anti-HIV treatment using the imaging technique and for determining the prognosis of an HIV infected subject.

-!- ALTERNATIVE PRODUCTS: CELL LINES PRODUCING IGG CONTAIN TWO MRNA SPECIES FOR IG GAMMA CHAINS. THE MAJOR SPECIES ENCODES SECRETED GAMMA CHAINS. THE MAJOR SPECIES PRODUCES BENEBRANE-BOUND CHAINS IN THAT IT CONTAINS AN ALTERNATIVE ? ENCOPED IN SEBARATE EXONS, THAT IS HOMOLOGOUS WITH THE MEMBRANE-BOUND SEGMENT OF MU CHAINS.

Alwote: cysteines at positions 24, 27, 33, 39, 42, 48, 54, 57, 63, 69, and 72 form in Bloches. Bloches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A; Wolecule type: protein
A; Residues: 1-289 <FRA>
A; Nete: the molecule is a dimer linked by 12 disulfide bonds; it has an extra interch
A; Note: the molecule is a dimer linked by 12 disulfide bonds; it has an extra interch
A; Note: this protein lacks most of the V region and all of the CHI region. Residue 12
A; Note: the sequence of residues 42-76 was taken from the reference that follows
B; Michaelsen, T.E.; Frangione, B.; Franklin, E.C.
J. Biol. Chem. 252, 883-889, 1977
A; Title: Primary structure of the 'hinge' region of human IgG3. Probable quadruplicat
A; Reference number: A02219; MUID: 77118561
A; Contents: normal gamma-3 chains, sequence corresponding to residues 12-97 of protei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A)Accession: A2219
A)Molecule type: protein
A)Residues: 12-97 AMC>
A)Note: the hinge region in gamma-3 chains is about four times as long as in other idue segment (12-28)
                                                                                                                                                                                                                                                                                                                                                                                                                                            A, Title: Primary structure of human gamma3 immunoglobulin deletion mutant: gamma3
                                                                                                                                                                                                                                         Gramma-3 heavy chain disease proteins - human C;Species: Homo sapiens (man) C;Species: Homo sapiens (man) C;Species: Homo sapiens (man) C;Species: 31-Dec-1979 #sequence_revision 23-Oct-1981 #text_change 16-Jul-1999 C;Accession: A90442; A92219; A90198; A93915; A02149 R;Frangione, B.; Rosenwasser, E.; Prelli, F.; Franklin, E.C.
